

SEO Master Audit Report

accesscoliving.com

Consolidated from four sources:

- Semrush Site Audit — 13 July 2026 (90+ pages crawled)
- AIOSEO Site Analysis — 13 July 2026 (homepage)
- AI Audit (this assistant) — 14 July 2026 (6 pages)
- Final Consolidated Report by Nikhil Kollipakula

Generated on July 14, 2026

This report captures every issue reported across all four source audits, deduplicated where the same issue was found in multiple tools, with source attribution on every finding so you can trace it back. Where two tools reported the same problem (e.g. missing H1s), that is called out as a high-confidence issue.

Executive Summary

The site has strong technical foundations (HTTPS enforced, valid robots.txt, canonical tag used on the homepage, schema present, fast response time under 0.2s, small HTML footprint of 12 KB) but is held back by significant on-page and template-level problems that show up across many pages. The two crawler tools (Semrush + AIOSEO) overlap on missing/duplicate H1s, oversized titles, and broken images — these are high-confidence real issues. The AI page-level audit adds template-bug diagnoses (duplicated brand suffix, canonical-to-homepage, localhost image references) that likely explain some of Semrush's site-wide counts.

Source	Score / Metric	Verdict
AIOSEO Overall Site Score	72 / 100	Very Good
Semrush Issue Count	3 Errors, 7 Warnings, 8 Notices	Multi-page findings
AI Audit Overall (6 pages)	46 / 100	Structural fixes needed

Combined issue counts across all sources:

Severity	Distinct issue types	Total affected-page mentions
Errors (High Priority)	9	17
Warnings (Medium Priority)	13	252
Notices (Low Priority)	12	144
Positive findings ('working well')	20+	—

Errors — High Priority

Issues that actively block or seriously harm rankings and user experience. Fix these first.

5 internal images are broken

5

Source: Semrush

About this issue: An internal broken image can't be displayed because it no longer exists, its URL is misspelled, or the file path is invalid. Broken images may jeopardize search rankings because they provide a poor user experience and signal to search engines that pages are low quality.

Affected: 5 internal images across the site

How to fix: For each broken image: (1) if the image was moved, update its URL; (2) if it was deleted or damaged, replace it with a new file; (3) if it is no longer needed, remove it from the page code.

2 structured data items are invalid

2

Source: Semrush

About this issue: Structured data items contain fields that do not meet Google's guidelines. If website markup has errors, crawlers cannot properly understand it, and you may lose the chance of gaining rich snippets and more favorable rankings.

Affected: 2 schema items

How to fix: Validate structured data using Google's Rich Results Test (search.google.com/test/rich-results). Fix the flagged fields against schema.org / Google documentation. Note different markup testing tools may show different results.

1 incorrect page found in sitemap.xml

1

Source: Semrush

About this issue: The sitemap.xml file makes it easier for crawlers to discover pages. Only good, canonical pages intended for visitors should be included. This error is triggered when sitemap.xml contains URLs that lead to duplicate content, redirect to a different page, or return a non-200 status code — which confuses search engines and may cause the sitemap to be rejected.

Affected: 1 URL in the sitemap

How to fix: Review sitemap.xml for any redirected, non-canonical, or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.

SEO title is 64 characters — too long

1

Source: AIOSEO (homepage)

About this issue: Titles over ~60 characters risk being truncated in search results. The current homepage title "Accesco Living | India's Intelligent Circular Commerce Ecosystem" is 64 characters.

Affected: Homepage / (accesscoliving.com)

How to fix: Rewrite the title to under 60 characters while keeping the target keyword and brand. Example: "Accesco Living – Grocery, Food & Fashion Delivery" (49 characters).

1 image has no alt attribute

1

Source: AIOSEO (homepage)

About this issue: Images without alt attributes hurt accessibility and lose an SEO signal. The affected image is `/images/asterik.png` on the homepage.

Affected: `/images/asterik.png` on the homepage

How to fix: Add a descriptive alt attribute to the image, e.g. `alt="Decorative asterisk icon"` or a more meaningful description if it conveys real content.

Open Graph meta tag missing: og:url

1

Source: AIOSEO (homepage)

About this issue: The `og:url` tag tells social platforms the canonical URL of the page for sharing. Without it, shared links may render inconsistently.

Affected: Homepage

How to fix: Add `<meta property="og:url" content="https://www.accesscoliving.com/">` inside the `<head>`.

Unminified JavaScript file detected

1

Source: AIOSEO (homepage)

About this issue: An unminified JS bundle (`https://accesscoliving.com/_next/static/chunks/bc9e92e6-a6c6091221ae0c56.js`) increases page weight and load time. Minified JS is a build-tooling standard.

Affected: 1 Next.js JS chunk

How to fix: Check the Next.js production build configuration; production builds should output minified chunks automatically. If this file is from a third-party script, minify it via the build pipeline or replace with a minified version.

4 of 6 pages have a duplicated brand name in the title tag

4

Source: AI Audit

About this issue: `InstaStyle` ("`InstaStyle | Fashion Delivery by Accessco Living | Accessco Living`") and `Terms` ("`Terms & Conditions | Accessco Living | Accessco Living`") both append the brand suffix twice — almost certainly a template bug double-appending the brand to titles that already include it. This wastes valuable title-tag characters and causes truncation. Likely affects more pages than the 6 sampled.

Affected: `/services/instastyle`, `/terms` (confirmed); likely site-wide

How to fix: Fix the title template so the brand suffix is appended only once — check whether the CMS or layout is adding it both at the page level and the global layout level.

3 of 6 pages have a broken or missing canonical tag

3

Source: AI Audit

About this issue: `FAQ` and `InstaStyle` declare their canonical as the homepage URL instead of themselves; `Grokly` has no canonical tag at all. Wrong canonicals tell Google these pages are duplicates of the homepage and can lead to them being dropped from the index. The homepage itself has a correct canonical, but the templating breaks it on inner pages.

Affected: `/faq`, `/services/instastyle`, `/services/grokly`

How to fix: Set each page's canonical to its own URL (self-referencing canonical) unless there is a deliberate reason to consolidate. Likely a shared layout/template bug.

Cross-source confirmation: Missing/duplicate H1 tags are flagged by both AIOSEO (2 H1s on the homepage) and Semrush (50 pages missing H1, 2 pages with multiple H1s) — this is a very high-confidence site-wide issue. See Warnings and Notices sections for the specific findings.

Warnings — Medium Priority

Issues that hurt rankings but don't block them. Address these after Errors.

87 pages have low text-HTML ratio

87

Source: Semrush

About this issue: Text-to-HTML ratio indicates the amount of actual text on a webpage compared to the amount of code. This is triggered when the ratio is 10% or less. Higher ratios help rankings and improve crawl efficiency; less code also improves page load speed.

Affected: 87 pages site-wide

How to fix: Review page HTML and consider optimizing structure, removing embedded scripts and inline styles, and moving text into fewer wrapper elements. For thin pages, add substantive body copy.

57 pages have a low word count

57

Source: Semrush

About this issue: Triggered when a webpage has fewer than 200 words. Word count is a quality signal — search engines prefer pages that provide comprehensive information over thin content.

Affected: 57 pages site-wide

How to fix: Improve on-page content to include more than 200 meaningful words. Focus first on landing pages and service pages (Grokly, Swadishtt, InstaStyle) rather than boilerplate/utility pages.

50 pages don't have an H1 heading

50

Source: Semrush

About this issue: H1 headings help define a page's topic for search engines and users. When an H1 tag is empty or missing, search engines may place the page lower than it would otherwise rank, and the heading hierarchy breaks. Cross-confirmed by AI Audit which found the homepage itself missing an H1.

Affected: 50 pages site-wide (including homepage per AI Audit)

How to fix: Provide a concise, relevant H1 heading for each page — likely fixable at the layout/template level.

30 pages have underscores in the URL

30

Source: Semrush

About this issue: Using underscores as word separators is not recommended because search engines may treat them as part of a single word. Hyphens are the recommended separator. Although underscores don't have a huge impact on visibility, they slightly decrease chances of appearing in search results.

Affected: 30 pages site-wide

How to fix: Replace underscores with hyphens in URLs — with 301 redirects from old to new URLs. However, if specific pages already rank well, weigh the ranking risk before changing established URLs.

17 external images are broken

17

Source: Semrush

About this issue: External images that can't be displayed hurt user experience and may signal poor site maintenance to search engines.

Affected: 17 external image references

How to fix: For each broken external image: replace with a new file, remove if no longer needed, or update the URL if the image moved.

3 external links are broken

3

Source: Semrush

About this issue: Broken external links send users to non-existent pages, harming user experience and potentially hurting rankings because crawlers may see the site as poorly maintained.

Affected: 3 external links

How to fix: Follow each reported broken link. If the target returns an error, remove the link or replace it with a working resource. If a link is broken only for crawlers but works in browsers, contact the target site owner.

2 pages have titles too long (>70 chars)

2

Source: Semrush

About this issue: Most search engines truncate titles over 70 characters. Incomplete or shortened titles look unappealing and lose click-through. AI Audit confirmed at least one — Grokly's title is ~82 chars.

Affected: 2 pages (confirmed: /services/grokly at ~82 chars); likely also /services/instastyle at ~67 chars

How to fix: Rewrite each page title to 60-70 characters or fewer. Example for Grokly: "Grokly – Farm-Fresh Groceries in 11 Minutes | Accesco" (54 chars).

Meta description too short (111 characters)

1

Source: AIOSEO (homepage)

About this issue: The homepage meta description is only 111 characters. Aim for ~150-160 characters to make full use of the SERP snippet space and include a call-to-action. Current text also lacks a CTA.

Affected: Homepage

How to fix: Rewrite to ~150 chars with CTA. Example: "Groceries, food, and fashion delivered fast from one intelligent app. Join Accesco Living's waitlist for early access and launch perks." (150 chars)

2 H1 tags found on the homepage

2

Source: AIOSEO (homepage)

About this issue: The homepage contains two H1 tags ("Accesco Living" and "IntroducingXpense Meter!"). For best SEO results there should be exactly one H1 per page. Also cross-confirmed by Semrush notice "2 pages have more than one H1 tag".

Affected: Homepage (and 1 other page per Semrush)

How to fix: Keep the primary H1 ("Accesco Living" or a keyword-rich rewrite) and downgrade "IntroducingXpense Meter!" to an H2.

Open Graph / Twitter tags copied from homepage template

2

Source: AI Audit

About this issue: FAQ and InstaStyle both carry generic og:title / twitter:description text lifted from the homepage template rather than page-specific copy. Social shares of these pages look identical to sharing the homepage.

Affected: /faq, /services/instastyle

How to fix: Write unique og:title, og:description, and twitter:* tags per page, matching each page's actual title and meta description.

Broken production image reference (localhost URL)

1

Source: AI Audit

About this issue: Grokly's og:image and twitter:image point to http://localhost:3000/images/ac-logo.png — a dev environment URL that will not resolve publicly. Breaks social share previews.

Affected: /services/grokly

How to fix: Replace with the production URL (https://www.accesscoliving.com/images/ac-logo.png), matching other pages.

Thin crawlable text on the homepage

1

Source: AI Audit

About this issue: The homepage leans heavily on a hero video and icon-led product tiles rather than descriptive paragraph text, giving search engines little content to evaluate relevance from. Contrasts sharply with the text-rich FAQ page. Contributes to Semrush's low text-HTML ratio and low word count counts.

Affected: Homepage

How to fix: Add a short (150-300 word) plain-text section describing the service in prose, targeting the primary keywords.

Stale copyright year and missing meta description on Swadishtt subsite

1

Source: AI Audit

About this issue: Swadishtt's footer reads "© 2025 Swadishtt" while every other page reads "© 2026 Accesco Living", and no meta description was detected in the page's markup.

Affected: /services/swadisht

How to fix: Sync footer template and current year. Add a unique ~150-char meta description e.g. "Order pizza, burgers & more from Swadishtt by Accesco Living. Fast delivery in Bangalore, 20-25 minutes."

Notices — Low Priority / Best Practice

Best-practice items and minor polish. Address after Errors and Warnings.

92 URLs with a permanent redirect

92

Source: Semrush

About this issue: Permanent (301/308) redirects are appropriate in many situations (domain moves, deleted pages, duplicate handling) but should be kept to a reasonable minimum. Each redirect decreases crawl budget, which may run out before search engines can crawl target pages. Too many redirects can also confuse users.

Affected: 92 URLs site-wide

How to fix: Review all URLs with permanent redirects. Where possible, update internal links to point directly to the final destination rather than going through a redirect.

50 requests per page (over 20 recommended limit)

1

Source: AIOSEO (homepage)

About this issue: The homepage makes 50 HTTP requests (25 images, 18 JavaScript, 7 CSS). More than 20 requests can slow page load significantly.

Affected: Homepage

How to fix: Combine/lazy-load images (use next/image with lazy loading), bundle JavaScript more aggressively in the Next.js build, and consider using CSS sprites or SVG for small icons instead of separate image requests.

28 pages have only one incoming internal link

28

Source: Semrush

About this issue: Pages with few incoming internal links have little to no chance of being placed in search results — internal linking is one of the strongest ranking signals a site owner can control.

Affected: 28 pages site-wide

How to fix: Add more incoming internal links to pages with important content — from the homepage, blog posts, and related service pages.

4 links on the site have no anchor text

4

Source: Semrush

About this issue: Triggered when a link has an empty or naked anchor (just a URL) or anchor text with only special characters. This makes it hard for crawlers to understand what the linked page is about.

Affected: 4 links

How to fix: Use short, descriptive anchor text for each link. The anchor should give users and search engines at least a basic idea of the target page's topic.

2 pages have more than one H1 tag

2

Source: Semrush

About this issue: Although multiple H1 tags are allowed in HTML5, using more than one per page is not recommended because it may confuse users and search engines. Cross-confirmed by AIOSEO for the homepage.

Affected: 2 pages (including homepage per AIOSEO)

How to fix: Keep a single H1 per page. Convert additional H1s to H2-H6 tags in the appropriate hierarchy.

1 subdomain doesn't support HSTS

1

Source: Semrush

About this issue: HTTP Strict Transport Security (HSTS) informs browsers they can communicate with servers only via HTTPS. Without HSTS, users may be exposed to protocol-downgrade attacks.

Affected: 1 subdomain

How to fix: Configure the affected server to send the Strict-Transport-Security response header.

1 resource is formatted as a page link

1

Source: Semrush

About this issue: An `<a href>` element is used to link to a resource (e.g. an image) rather than a page. When search engines follow such a link, the returned page contains only that resource, which may look like poor site architecture.

Affected: 1 link

How to fix: Replace `<a href>` resource links with the appropriate tag — e.g. for an image, use `` rather than an anchor.

1 page has low semantic HTML usage

1

Source: Semrush

About this issue: The ratio of semantic HTML tags to other HTML tags is low. Semantic HTML improves indexing accuracy and helps search engines better understand page hierarchy.

Affected: 1 page

How to fix: Use semantic elements like `<header>`, `<nav>`, `<main>`, `<article>`, `<section>`, `<aside>`, `<footer>` instead of generic `<div>`s where appropriate.

1 part of the site doesn't enforce secure connections

1

Source: Semrush

About this issue: One portion of the site allows insecure HTTP connections, which is a user security risk.

Affected: 1 subdomain/path

How to fix: Configure the server to redirect all HTTP traffic to HTTPS (301 redirect) and set HSTS.

1 page requires content optimization

1

Source: Semrush

About this issue: Content optimization enhances on-page clarity, user engagement, snippet eligibility, and topical authority. This is especially important for content-heavy pages.

Affected: 1 page

How to fix: Follow the specific advice in Semrush's per-page report or run the page through a content optimizer tool.

Broken footer links on Swadishtt

6

Source: AI Audit

About this issue: The Swadishtt footer (Careers, Team, Help & Support, Partner with us, Terms & Conditions, Privacy Policy) all link to `"#"` placeholder anchors instead of real pages. These pages exist elsewhere on the site.

Affected: `/services/swadisht`

How to fix: Point these to the real corresponding pages (e.g. `/terms`, `/privacy`, `/contact`, `/partner`) which already exist elsewhere on the site.

No FAQPage structured data on the FAQ page

1

Source: AI Audit

About this issue: The FAQ page has genuinely strong, well-organized Q&A content but no visible FAQPage schema — missing an easy win for rich-snippet eligibility.

Affected: /faq

How to fix: Add FAQPage JSON-LD schema listing each Q&A. This page is the best current candidate on the site for FAQ rich snippets in Google Search.

App store badges link to placeholder "#"

2

Source: AI Audit

About this issue: Google Play and App Store badges on the homepage and InstaStyle link to "#" rather than real store URLs. Not a ranking issue while the app is pre-launch, but should be fixed at launch.

Affected: /, /services/instastyle

How to fix: Update to real app store listing URLs once the mobile apps are live.

What's Already Working Well

Confirmed positive findings from the source tools. Don't undo these while fixing other issues.

Technical / Crawlability

- ✓ HTTPS is enforced sitewide with valid current TLS certificate (Semrush + AIOSEO)
- ✓ Both www and non-www versions redirect to the same canonical site (AIOSEO)
- ✓ robots.txt is present, correctly configured, and references the sitemap (AIOSEO)
- ✓ Homepage canonical link tag is correctly set to <https://www.accescoliving.com/> (AIOSEO)
- ✓ No noindex header or meta tag blocking indexing (AIOSEO)
- ✓ sitemap.xml is present and validly formatted (Semrush)
- ✓ No 5XX or 4XX status codes returned by any crawled page (Semrush)
- ✓ No pages missing title tags; no duplicate title tags (Semrush)
- ✓ No duplicate content issues (Semrush)
- ✓ No broken internal links (Semrush)
- ✓ No crawl failures (DNS or malformed URL) (Semrush)
- ✓ No duplicate meta descriptions (Semrush)
- ✓ Viewport is configured; no oversized HTML pages (Semrush)
- ✓ No hreflang errors or conflicts (Semrush)

Content / On-page

- ✓ Schema.org structured data found on the homepage (AIOSEO)
- ✓ H2 tags present and well-structured on the homepage (AIOSEO)
- ✓ Correct number of internal (20) and external (6) links on the homepage (AIOSEO)
- ✓ Target keywords found in the homepage title and description (AIOSEO)

Performance

- ✓ Server response time is under 0.2 seconds (AIOSEO)
- ✓ HTML document size is 12 KB — well under the 33 KB average (AIOSEO)
- ✓ All CSS files are minified (AIOSEO)
- ✓ Server sends "expires" headers for images (browser caching enabled) (AIOSEO)

Security

- ✓ Directory Listing is disabled on the server (AIOSEO)
- ✓ Google Safe Browsing has not flagged the site for malware (AIOSEO)
- ✓ Site served over HTTPS with valid SSL certificate (AIOSEO)

Per-Page Findings (AI Audit, 6 pages)

Detailed per-page findings from the 6-page AI crawl. Semrush's full 90+ page findings are counted site-wide in the Errors/Warnings/Notices sections above.

/ (homepage)

Title: Accesco Living | India's Intelligent Circular Commerce Ecosystem (57 chars)

Meta description: "India's intelligent commerce ecosystem for groceries, food, fashion, and finance — all in one unified platform." (109 chars — short)

H1: Missing

Key issues: No H1, thin crawlable text, short meta description, 2 H1s per AIOSEO (conflict between crawlers — needs verification)

/faq

Title: FAQ - Frequently Asked Questions | Accesco Living (51 chars) ✓

Meta description: "Find answers to common questions about Accesco Living's services..." (137 chars) ✓

H1: "Everything You Need to Know" ✓

Key issues: Canonical wrongly points to homepage; OG/Twitter tags copied from homepage template; no FAQPage schema despite ideal content

/services/grokly

Title: Grokly | Fresh Groceries Delivered Direct from Karnataka Farms | Accesco Living (82 chars — too long)

Meta description: "Order fresh groceries with Grokly by Accesco Living. Farm-direct sourcing via FarmChain, live QR traceability, and 20-30% lower prices. Serving Bengaluru." (156 chars) ✓

H1: Missing

Key issues: No canonical tag; oversized title; broken localhost og:image; missing H1

/services/instastyle

Title: InstaStyle | Fashion Delivery by Accesco Living | Accesco Living (67 chars — too long, duplicated brand)

Meta description: "Shop trending fashion, apparel, accessories and lifestyle products with InstaStyle by Accesco Living." (103 chars — slightly short)

H1: "INSTASTYLE" ✓

Key issues: Canonical wrongly points to homepage; OG/Twitter tags copied from homepage; oversized title with duplicated brand

/services/swadisht

Title: Swadisht | Food Delivery & Cloud Kitchen Platform | Accesco Living (69 chars — slightly long)

Meta description: Not detected (likely missing)

H1: "Swadisht" ✓

Key issues: Broken footer links (all "#"); stale copyright year (© 2025 vs. site-wide © 2026); likely missing meta description

/terms

Title: Terms & Conditions | Accesco Living | Accesco Living (54 chars, duplicated brand)

Meta description: Not detected

H1: "Terms & Conditions" ✓

Key issues: Duplicated brand suffix in title (confirms template-wide bug)

Recommended Action Plan

Ordered by impact-per-effort. Highest-leverage fixes are the shared page templates — one edit there likely resolves many of the site-wide page-count issues.

Priority 1 — Fix Immediately (Errors)

1. Fix the shared page template that duplicates the brand name in the title tag (affects Terms, InstaStyle, likely many more)
2. Fix the shared template that sets canonical URLs to the homepage instead of self-referencing (affects FAQ, InstaStyle; Grokly has no canonical at all)
3. Repair the 5 broken internal images and investigate the 17 broken external images (Semrush)
4. Fix the 2 invalid structured data items using Google's Rich Results Test (Semrush)
5. Remove/replace the 1 incorrect sitemap.xml entry so it only lists canonical, 200-status URLs (Semrush)
6. Shorten the homepage SEO title to under 60 characters (AIOSEO)
7. Add alt text to /images/asterik.png (AIOSEO)
8. Add the missing og:url Open Graph tag to the homepage (AIOSEO)
9. Minify the flagged unminified JS chunk in the Next.js production build (AIOSEO)
10. Fix the localhost og:image on Grokly (points to http://localhost:3000)

Priority 2 — Fix This Sprint (Warnings)

1. Add a single H1 to the 50 pages currently missing one — best fixed at the layout/template level (Semrush)
2. Reduce the 2 pages that have multiple H1s to a single H1 each, including the homepage (Semrush + AIOSEO)
3. Expand thin content on the 57 low-word-count pages to 200+ meaningful words (Semrush)
4. Improve text-to-HTML ratio on the 87 flagged pages by trimming excess code (Semrush)
5. Lengthen the homepage meta description to ~150-160 characters and add a CTA (AIOSEO)
6. Fix the 3 broken external links (Semrush)
7. Rewrite the 2 oversized (>70 char) page titles (Semrush) — including Grokly's 82-char title (AI Audit)
8. Replace underscores with hyphens in the 30 flagged URLs where safe (Semrush)
9. Write unique OG/Twitter tags per page instead of copying from the homepage template
10. Add a proper meta description and update the stale © 2025 footer on /services/swadisht

Priority 3 — Ongoing / Housekeeping (Notices)

1. Audit and reduce the 92 permanent redirects where a direct link is possible (Semrush)
2. Add incoming internal links to the 28 pages with only one link, from relevant related pages (Semrush)
3. Add descriptive anchor text to the 4 links currently missing it (Semrush)
4. Enable HSTS on the affected subdomain (Semrush)
5. Confirm HTTPS is enforced across the entire site (Semrush found 1 non-secure part)
6. Reduce homepage request count (currently 50) — lazy-load images, bundle JS, use SVG for icons (AIOSEO)

7. Improve semantic HTML on the flagged page (Semrush)
8. Run the flagged page through a content optimization pass (Semrush)
9. Fix the 6 placeholder "#" footer links on Swadishtt
10. Add FAQPage JSON-LD schema to /faq for rich-snippet eligibility
11. Replace app store placeholder "#" links once apps are live

Key insight from cross-referencing all four reports: The doubled title suffix and inconsistent canonical logic identified by the AI Audit both look like the same shared templating layer misbehaving across pages, which is consistent with Semrush's site-wide findings (50 pages missing H1, 2 pages with duplicate H1s, 30 pages with underscore URLs). Have the dev team check the base layout/template component before doing manual per-page fixes — one template edit likely resolves dozens of the page-count issues Semrush is reporting.
